5 ways to safeguard your samples & make your freezer last longer...

1. Routinely remove ice build-up by gently cleaning with an ice scraper or a soft cloth. Be extra careful not to damage gaskets and door seals.

2. Let it breathe
- Check your filters are clean
- Position your freezer so there is at least 150mm of space around, behind and above it
- Avoid storing anything on top of, or immediately around your freezer.

3. Clear out & defrost. Remove old items to make space and prevent ice build-up by defrosting regularly.

4. Keep an inventory to keep samples organised & easily accessible.

5. Make smart purchasing decisions. Avoid purchasing a new unit by cleaning out and consolidating where possible. Replace freezers older than 10 years.
